

Plant Fact Sheet

GULF BLUESTEM

Schizachyrium maritimum

(Chapman) Nash

Plant symbol = SCMA3

Contributed by: USDA NRCS Golden Meadow Plant
Materials Center, Galliano, Louisiana

Alternate Names

Seacoast bluestem; *Andropogon maritimus*

Uses

Conservation plant material for coastal beach dune enhancement and stabilization. Habitat for small mammals, shorebirds, and migratory birds.

Status

This species is ranked on the Rare, Threatened, and Endangered Species state heritage conservation status lists in Alabama and Louisiana as an S1 (extensive rarity and factors which make it especially vulnerable to extirpation), and a global ranking by NatureServe.org of G3 (very rare and local throughout its range).

Please consult the PLANTS Web site and your State Department of Natural Resources for this plant's current status (e.g. threatened or endangered species, state noxious status, and wetland indicator values).

Description

Gulf bluestem is a native, warm-season, perennial grass that spreads by seed and short rhizomes. Plants are rhizomatous and colonial, stems usually

decumbent, glaucous, reddish, and flattened at the base, terminal inflorescences with stalked spikelets. Found native to coastal and offshore islands of the Florida panhandle west to Louisiana.

Adaptation

Establishment

Gulf bluestem can be successfully established using container grown or bareroot plant materials. Vegetative propagules from plant division or lower stem nodal tissue are used for nursery production. Container grown or bareroot propagules should be planted on 2-5 foot centers on the primary dune ridge and back side and the more stable dune and swale areas behind the primary dune. Interspacing with other desirable dune species enhances habitat diversity and conservation effectiveness. Apply a blended fertilizer broadcast or slow release tablet or packet with each plant when planting. Gulf bluestem produces viable seed. The potential establishment of gulf bluestem by seed is being evaluated at the Golden Meadow Plant Materials Center in Galliano, Louisiana.

Management

No special management strategy is needed other than restricting traffic during the first year of establishment.

Pests and Potential Problems

There are no pests of concern associated with this species.

Cultivars, Improved, and Selected Materials (and area of origin)

Timbalier Germplasm Gulf Bluestem is a tested pre-varietal plant materials release available from the USDA Natural Resources Conservation Service, Golden Meadow Plant Materials Center in Galliano, Louisiana.
